

MANAGED SERVICES

Manage and secure your web presence more efficiently and extend its capabilities with WebServer Managed Services.

Managed Firewall

With the attacks proliferating the Web, securing your servers is becoming inevitable. Webserver provide you the secured firewall solution to protect your server from unwanted intrusion. Our experienced security engineers monitor your firewall appliances to trace attacks or intrusion attempts. As part of this service, we would periodically perform vulnerability assessments.

Today's mission-critical information must be reliably and dynamically protected from unauthorised access, sabotage, and viruses. This cannot be achieved with a one-off purchase of hardware and software or by employing staff who aren't fully conversant with security issues. Webserver Managed Firewall service is a total firewall solution that begins with onsite configuration followed by implementation of hardware and software with guaranteed service levels. It works in combination with Webserver VPN or Dedicated Connect services to provide entirely secure networking and connectivity across local and foreign country.

To offer the best available package, Webserver has also partnered with two of the world's leading producers of state-of-the-art firewall software components, hardware and service; Check Point and Netscreen. And the leading-edge hardware and software solutions are backed up with 24/7 customer care and support, including monthly consultation, an optional free back-up unit, remote and on-site maintenance, reconfiguration, software upgrades, patches, and security incident management.

VPN Services

This service is an extension of the managed firewall service by providing secured link from your office to your servers. Our advance VPN solution provides reliable point-to-point security across the Internet by encrypting all data transferred.

The growth of e-commerce and other IP-based applications has underlined the importance of single network design. Corporate networks have to be extended to include new partners, suppliers and customers; even higher standards have to be met with regard to speed, quality and security. Webserver's VPN enables all this in a single end-to-end managed solution.

The latest release of the Webserver VPN service includes the following new features; small office solution, and the most aggressive availability guarantee yet available in the market. The small office solution enables companies with small branch offices to connect to the network with a dial up connection.

To ensure total data security the service also combines seamlessly with Webserver's state-of-the-art Managed Firewall services.
