

ANTI SPAM

Spam Filter Gateway designed for owner's and companies running their mail server servers.

With our latest inclusion of 4 tiered anti-virus protection features and proprietary processing rules on our mail servers for all e-mail users, you'll be assured of virus free e-mails and junk-free e-mails to your mailboxes.

More companies have outsourced their e-mail service to us as our services have proven reliable. We have earned the trust of over 20,000 e-mail users for processing over 50,000 e-mails daily on our mail servers. Let us take the hassles out of e-mail servers from you so you can return to your core business with confidence!

Spam Filter Gateway features

Rate controls

Utilized to stop denial of service attacks as well as dictionary based spam attacks. These are integrated in SpamFilter.

File type attachment blocking Known malicious file types are blocked from entering your e-mail. These attachments are also scanned using the built-in Anti-Virus protection.

Checksum technology

SpamFilter monitors email traffic through the Internet and uses checksum technology to keep track of the number of times a particular message has appeared on the Internet. If a message has appeared over a certain number of times, it is categorized as known spam. Checksums of known spam messages are utilized by SpamFilter to block spam messages.

Anti-Virus Protection

In addition to anti-spam protection, SpamFilter provides protection against e-mail based threats such as malicious viruses and worms, which is where 95%+ of the viruses originate. This additional measure is built-in to our service and updates on a hourly basis to ensure the latest definitions are in place.

Blacklisting of websites & domains

SpamFilter maintains an up to date list of the largest and most aggressive known spammers. This list is maintained by both SpamFilter and other anti-spam groups. This list is automatically updated on each SpamFilter Spam Firewall.

Keyword scanning of emails

Our scanning methods include a scoring system such that emails are scored based on a number of criteria. If the score is above a threshold, then that email is flagged as spam. The SpamFilter team constantly monitors and updates these keywords based on current activity so there is virtually no lost messages.

Message authenticity checking

Several algorithms are utilized to verify the authenticity of a message. Some of these are simple checks to verify that the "from address" is authentic. Some are more complex relating to SMTP protocol.

Blacklists and Whitelists

Domains, IP's, and email addresses can be blocked or whitelisted (allowed through).
